

What is SSL?

SSL is the secure version of Hypertext Transfer Protocol (or HTTP) at the beginning of your web address.

When browsing on an https site, your session is encrypted with a digital SSL certificate.

SSL helps create a safe and secure connection for your webpages, keeping customers information safe from hackers, criminals and other unwanted eyes.

Why use SSL?

If your website transmits sensitive information like credit card details or personal information, you need to secure it with SSL encryption.

Protection from hackers and identity thieves.

Gain customer trust.

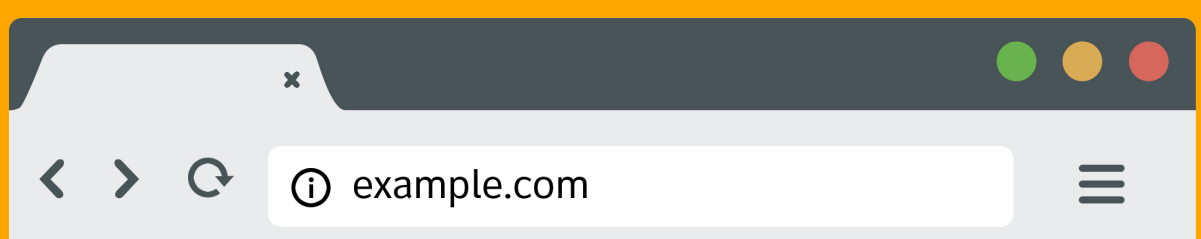

Part of PCI compliance for accepting credit cards.

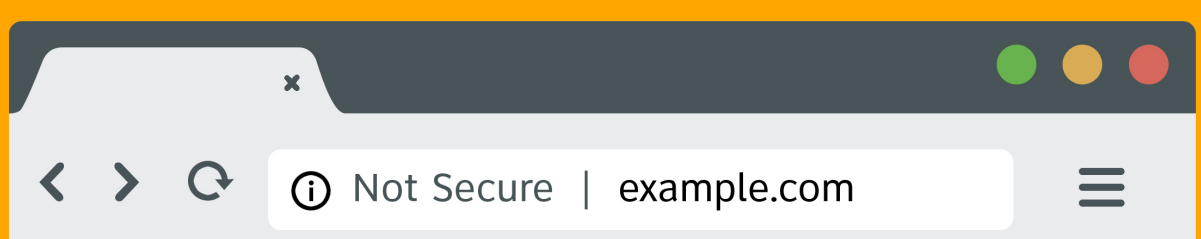

Future SSL...

Beginning in July 2018 with the release of Chrome 68, Chrome will mark all HTTP sites as “not secure”. Other browsers, like IE, Edge, Firefox will be following suit.

Current Chrome

July 2018 Chrome

Developers have been transitioning their sites to HTTPS and making the web safer for everyone. Progress last year was incredible, and it's continued since then.

85%

85% of online shoppers avoid unsecured websites.¹

79%

79% of compromised websites flew under the radar of search engines' safety systems.²

31.5%

31.5% websites have already moved from HTTP to HTTPS since 2014.³
